The webinar is aimed at cities and municipalities, counties, regions, marine and maritime authorities, maritime and coastal economic operators, academia and civil society organisations.

As an integrated process, Maritime Spatial Planning (MSP) aims to cope with the increasing demand for marine space and resources from traditional (e.g., maritime transport, tourism, fisheries) and emerging sectors (e.g., sustainable aquaculture, offshore renewable energy, blue bio-economy), while preserving marine ecosystems and their services. MSP implies the reduction and mitigation of impacts on the environment, resolution of conflicts and exploitation of synergies among different sectors. Being a long-term and far-reaching process, MSP should take climate change into consideration in several ways – by assessing direct and indirect impacts of climate change on the environment and the maritime sectors, providing space for offshore renewable energy production, advancing other mitigation measures (including “blue carbon” initiatives), supporting climate-proofing of maritime sectors and the implementation of coastal and marine adaptation measures.
